Since the ASUS Eee PC has become the choice of many users since it was launched, its roadmap is always in the center of attention, especially since information on it comes from almost everywhere. For now, we can say that one of the "company's representatives" announced the release of a 3G version of the Eee PC somewhere in September. The new version will be shipped to Europe as an alternative to the WiMax version we've already seen launched and demonstrated. The HSDPA/HSUPA enabled mini-laptops will be priced depending on the contract. There is not much left to say about the Eee PC, as it has been turned on all its faces over and over, yet there are still surprising things to discover about it from time to time. One of them would be a white-pearl version of the mini-device. Users are able to play, entertain or work while on the go, and also enjoy a stylish, yet shock-proof design. This mobile PC is light and ultra-compact and can be carried out anywhere. There are no worries regarding bumps and shocks, and it will also stand up in the crowd. The Eee PC is a most agreeable device, we all already know what those three Es stand for: Easy to learn, work, play; Excellent Internet experience and Excellent on-the-go. It features a power-efficient technology that allows it to operate for extended periods of time, and it also enhances users' Internet experience, especially because its flexibility allows it to come either with the integration of the familiar Windows XP interface or with a pre-installed version of the same operating system. The Eee PC still has more to offer. Users can stay connected all the time with built-in WiFi 802.11 b/g capable of automatically detecting and connecting to Internet at any hotspot. This feature offers the possibility of instantly logging in to mail accounts, as well as uploading or downloading music, photos or videos. It also features built-in webcam, speaker, microphone and card reader. After all, this mini device offers big features.
