[AdapTex Predicts What You're Going to Write](#)

The software will be delivered for Windows Mobile 5.0/2003 OSs.

The guys from KeyPoint Technologies have launched a new kind of prediction software that will surely make your [cellphone](#) typing skills get better each day. As they say on the product's website "AdapTex accelerates text entry to a new level by suggesting complete words or phrases, allowing entry with a single touch. It gives superior predictive accuracy because it learns your vocabulary and adjusts to the context of your applications". This is a software that will get the best out of any text entering challenged individual and this way, if you decide to pay the money to be able to use it, AdapTex will prove to be a lifesaver. As a [prediction](#) software, instead of replacing every single second what you are trying to write, the application will augment the phone interface helping you to type faster by suggesting words that might fit in the context of the text you are writing. There is a slight problem with all this help provided by AdapTex: the guys that type really fast even without the help of this software will feel somewhat troubled by all the suggestions that appear on the bottom side of the [Pocket PC](#) screen and this will, in most cases, draw their attention and will have as an end result a much longer time until the last letter of the text will be typed. So if this is your case, you will probably do better without it and only hint your less experienced smartphone typing friends about it. For the ones that want to give it a try, there is a beta version on the official website www.adaptexlive.com that will let you experience all its goodness for a 14 days evaluation time. If and when you think you really need it, you can go for it and pay the 20 \$ necessary to get the full version and this way, you will be on a sure way to the mobile typing heaven.
