[Firefox Now Does VoIP](#)

Zoep Firefox

The open source browser did a number of things beside the basic display of websites even before the Zoep FireFox Extension, but now you can add VoIP calling to the powers of the mighty browser. The extension is a creation of VoIPSter and it will enable users to launch free telephone calls and chat directly after installing the Firefox pro-extension from <http://www.zoep.com/firefox>. It only takes a click of a button and users will be able to enjoy a true to life "seamless" experience without being forced to switch between applications in order to browse webpages and engage in VoIP calls at the same time. All this is possible thanks to Zoep's interface in Firefox, which is designed to integrate perfectly and has Firefox's look and feel. This easy-to-use extension makes initiating and receiving free calls using the OpenZoep VOIP platform as simple as a mouse click. According to VoIPSter, users will be able to communicate with any other VOIP user on the open source-based OpenZoep platform, which basically means that besides other Zoep users, they can also call users on the Jabber platform including, sometime in the near future, those using Google Talk.
