LG KB1800 DMB Phone with PC-OUT

The handset will provide its users with phone to PC connectivity for broadcasts.

This mobile phone from LG seems to be the usual **DMB** that is released from time to time by the mobile phone manufacturing companies in Asia, but it has something out of the extraordinary to brag about. The LG KB1800 mobile handset will offer its users PC to phone connectivity through a PC-OUT technology that will permit them to watch and record live broadcasts received on the cell phone directly on the personal computer. The handset will also offer picture enhancing technology through the built-in Mobile XD chipset, together with a **TFT-LCD** display of extraordinary quality that will make you enjoy a superior type of TV viewing experience than those that you have been used to, plus **USB 2.0** connectivity and a media player to listen and watch all your favorite music and videos. The date and the store price of this device isn't yet known, but as you have already guessed by now when reading about its DMB capabilities, it will be released somewhere in Asia and you can also put this one on your wish list until you'll have access to that type of technology. From what I know, I can tell you that this won't happen very soon, so the list is going to get really big until that happens.
