## **Motorola Ming Chooses Windows Mobile for the US Launch**

*An upgraded version of Motorola Ming will soon hit the US*

Motorola Ming is currently preparing for a release in the US. People at Motorola are polishing its case, dusting off its concept and also thinking of throwing in Windows Mobile in the **package** as to increase the interest over this device. These are not the first updates which have been performed on the Motorola Ming concept. Probably with the same intentions in mind, the handset has been recently upgraded, but with no thoughts in mind for bringing Windows Mobile into discussion. The **Motorola Ming** comes with a unique and appealing design and a touchscreen which also comes with a stylus and protective cap. Moreover, it is also capable of recognizing handwriting, which has high chances of appealing to a large number of people, especially to those using alphabets not included in the keypad. Moreover, this handset comes with support for a large number of media files and also provides fast data transfer solutions through HSDPA technology. It proves to be one of the most evolved solutions for email and instant messaging. Moreover, it comes equipped with a 2 megapixel camera which will manage to respond to the need of taking image and video captures at an acceptable quality. Motorola Ming has been working on Linux platform until now, but producers seem to have something different in mind for the US launch. The fact that they plan on releasing a 3G version of the phone in this country leads to the conclusion that it will be a Windows Mobile device. This is because JUIX is not capable of providing this feature at top performances. Windows Mobile will manage to support both the touch interface and the new 3G connection, which makes this operating system the best one to choose for the US launch of the Motorola Ming phone model in its upgraded version.
