Motorola Q9m

[Motorola Q9m \(Nelson\) Spy Shot Images](#)

Someone got his/her hands on Motorola Q9m

Some new images of the [Motorola](#) Q9m smartphone have appeared lately. This is the first handset coming from Motorola that fully supports Windows Mobile 6. The difference between this smartphone and all others from the Q9 line of handsets coming from Motorola is that the "m" actually stands for "music". This device is meant to provide the most evolved solutions for [music](#) listening. This has high chances of providing some competition for the iPhone. On the other hand, what new high-end device has not been considered at a certain time to be a possible killer for Apple's phone due to a specific function? One handset which would truly bring down the iPhone myth would most probably have to manage to bind all these features together. Motorola Q9m comes with a rather practical appearance. One thing which might make it stand out from other smartphones is that it has a red glow around the d-pad, which adds an extra touch of style to it. Besides, it does not look so spectacular, although the full QWERTY keypad and the reasonably large screen will surely receive appreciation from the user. Considering the fact that Motorola Q9m actually follows the same design pattern of all the other Q9 line of phones, the size of the screen is most probably 2.4 inches, which sounds just enough for a high quality display of images and easy navigation. Further specifications for this smartphone reveal that it comes equipped with a 1.3 megapixel [camera](#), which is below the average image capture performance that we would expect from such a device. Moreover, Motorola Q9m has a rubberized back which makes handling a great deal easier and more comfortable. Motorola Q9m will soon be available for purchase at Verizon wireless. An estimate price that this smartphone will come at has not been specified yet.
