[Motorola VE66 Brings CrystalTalk Technology](#)

Clearer conversations and pictures

[Motorola](#) brings with the VE66 new call and multimedia technologies, meant to outmatch any other device on the market as far as these particular features go. Also, Motorola is now offering customers faster access to the type of information they require, for it has integrated its first widget on this particular phone.

"The MOTO VE66 delivers on consumer's demand for more personalized listening and imaging experiences on a mobile phone," Corporate Vice President, Mobile Devices, Motorola, Tracey Koziol, declared about the VE66. "With a diverse multi-media experience, the VE66 truly enables you to make a statement and express yourself on your terms."

The newly developed [CrystalTalk](#) technology means that, now, communicating in loud places will be much easier, thus the calling experience is enhanced at all times, and not only when there's "peace and quiet" around you. This technology works in a simple way, by amplifying the volume of your conversation, so that you will have no problems with understanding whatever you are listening to, and then helping block out the background noise, thus creating something like a "field of force" around you when you're having a conversation. In addition to all this, a second microphone is included to make sure that your conversation will go on undisturbed.

Equipped with a 5 Megapixel camera and certain features that would be generally found on dedicated digital cameras, this slider also makes snapping pictures really easy and effective. It starts by stabilizing the image on its own, then uses its autofocus capabilities for clearer images, and finally activates the LED flash only if necessary. The colors are much more realistic, while the red eye factor is reduced considerably.

Using the Fast Scroll navigation wheel, sailing anywhere in the menus becomes very smooth, while downloading your favorite music or sharing photos is very easy thanks to the Wi-Fi connectivity and the Mp3 player with USB2.0.

The release date for the [VE66](#) is set for sometime towards the end of the year, but no pricing information is available at this point yet. However, rumors are saying that it will be available in two versions, one of which will be for China and will not be available with 3G support.
