## [New Spy Shot of Sony Ericsson M610i Lizy Phone](#)

*The phone has just been FCC approved*

Sony Ericsson Lizy phone model has been seen on very few [occasions](#) up to this point. From this reason, the new image that has been going by for the past few days has naturally opened the door for speculations and discussions on the phone's features. Unfortunately, there is little information available on the Sony Ericsson Lizy phone. Among the few sure things known about it is that it supports Bluetooth and Wi-Fi connectivity. This places it among the cellular models that offer a large amount of information to its users at fast and reliable transfer rates. Moreover, it is a tri-band phone, which supports GSM900/1800/1900 networks. The cell phone follows the path line set by the Sony M600i model when it comes to design. Instead of plastic, it now has a metal case. Even more, it shares the same keypad with the M600 phone model, as to provide QWERTY keyboard on the number buttons. Considering its simple design, this promises to be a considerably [practical](#) phone model, that will come as great help for information transfer. Moreover, the Wi-Fi connectivity means that it can easily handle media, by downloading music, images and videos to be later listened or viewed. Sony Ericsson M610i Lizy also comes equipped with a camera and a series of features that are expected to at least match those of the M600 model. For this reason, the Lizy phone will most probably be 3G enabled and also run on Symbian OS. Media support, such as MP3, video rendering and email are also expected to be provided at high quality. Even more, it is left to see if the TFT touchscreen will also be capable of recognizing handwriting, as it was the case with the other phone model. Sony Ericsson M610i has just finished FCC testing and has been approved. A date for its release has not been revealed so far.
