[New smokeless cigarette delivers full smoking satisfaction](#)

With no smoke, tar or carbon monoxide

The U.S. Government has approved a new smokeless cigarette for market. The Aeros Smokeless Cigarette requires no heat for use and delivers no smoke, tar or carbon monoxide. The new technology cigarette also automatically regenerates itself. The manufacturer reports that one Aeros can deliver an eight puff use over 40 times before being depleted. Just one or two Aeros carried in pocket or purse can last the user all day. Aeros is made using a special sealed plastic tube that preserves the freshness of the tobacco inside. When the tube ends are cut, tobacco extract vapors are released with each puff. The invisible extract vapors include natural tobacco flavors and nicotine. Aeros may be used anywhere without restriction. The new cigarette leaves no smoker's breath, tar stains on teeth or odors on clothing and furniture. The Aeros Smokeless Cigarette was fully tested and evaluated by the U.S. Government before being approved. An independent laboratory that tested Aeros using the FTC method reported -0- tar and .05 milligrams nicotine delivered with each eight puff use. The full test report may be viewed at the manufacturers website www.aerosinfo.com. The developer of the Aeros Smokeless Cigarette is Woodleaf Corporation of Newport Beach, California. The product is available only through the company's website. A company spokesperson stated; "It took eight years of R&D. The government agencies involved with the approvals were extremely thorough but also helpful and forward thinking in their deliberations. Now the smokeless cigarette is finally a reality. No smoke, no tar, low nicotine and it still delivers all the taste, control and instant satisfaction of a full strength ignitable cigarette". The Aeros Smokeless Cigarette was developed due to the ever increasing number of "No Smoking" areas and the need for an alternative tobacco product. For centuries there has been only been two types of tobacco products; each causing severe health problems. Ignited tobacco delivers harmful smoke. Tobacco that contacts skin (chew, snuff) causes ulcerations to delicate tissue. The patented Aeros technology produces no smoke and tobacco leaf never touches the skin. The company is not making health claims for the Aeros Smokeless Cigarette and recommends people consult their physicians on health matters or stop smoking programs. The manufacturer advises interested persons to copy the full Aeros test report from the company's website and present it to their physicians for evaluation.
