[Nokia Touchscreen Phone Concept Made in Brazil](#)

Simplicity and elegance

Amidst the hype created by the official presentation of Nokia's latest [N85](#) and [N79](#) Nseries handsets, few might have noticed a newly-appeared concept phone that comes as one of the most interesting "unreal Nokias" seen so far. Designed by [Ulisses Gardim](#) from Sao Paulo, Brazil, the new Nokia concept (which was not given a name) surprises us with its simple elegance, and it looks like nothing Nokia has done until now. Moreover, it's also different from the so-called [Nokia Tube](#), the first full-touch phone to be commercially released by the Finnish manufacturer. While the Tube has "soft" and rounded edges, the Brazil-designed Nokia comes with square edges, thus appearing more like a modern sculpture than a mobile device. The new concept might look like it has an alphanumeric hardware keypad, but it actually doesn't. There is only a wide touchscreen display that is somehow divided in two: the upper part is where the phone's User Interface appears, while the lower one has the role of a "keypad simulator." Unfortunately, the creator of the new and unreal Nokia did not mention what it should feature (save for a photo camera and expandable memory - but these are included by default in most of today's mobile devices). Anyway, if ever built in reality, the handset should feature advanced Web and Multimedia capabilities, a touchscreen display larger than 3 inches (maybe with a VGA resolution), HSDPA connectivity and - why not - GPS and Wi-Fi too. Its size could be similar to the one of HTC's latest and weird [S740 smartphone](#), hence somewhere around 116 x 45 x 16 millimeters. Of course, Nokia might never plan to create a handset that looks like this one, but there's a chance the Finish giant's designers might want to consider such a project. With a good functionality, the resulting device could be a real touchscreen hit.
