[Steve Jobs Keynote on June 9. WWDC '08 Countdown Begins.](#)

Apple's CEO to deliver a keynote address marking the beginning of this year's WWDC; Apple offers WWDC '08 countdown widget on its website

Fortune is [reporting](#) that Steve Jobs is to deliver a keynote address come June 9th, the day the **World Wide Developers Conference (WWDC) 2008** commences. Naturally, everyone is thinking **3G iPhone**, but that's certainly not all Steve has up his sleeve. Hey, that rhymes! The above-mentioned publication notes Gene Munster's report to clients on Monday, in which he stated the following: "The launch of the new model is imminent." A renowned analyst's word might still not be enough to convince skeptics of the new iPhone's arrival. They should check out [this piece](#), about an independent developer who posted an iPhone 2.0 screenshot on its blog, depicting several 3G-related strings in the fifth beta of the upcoming iPhone firmware. So, while iPhone firmware 2.0 Beta 5 confirms 3G support, with analysts going on and on about [what "other" features the new model may sport](#) aside 3G networking, what else is there to look forward to WWDC '08? Lots more, actually, otherwise Apple wouldn't have set up this [countdown timer](#) to the day that Apple's World Wide Developers Conference (WWDC) begins. Sure enough, the new iPhone will be taking up much of the space and allocated time for the conference (check out WWDC '08 iPhone Sessions), but then what are the developers struggling to win first place for, say... The Best Mac OS X Leopard Application, going to do? Last month, Apple disclosed the [Categories and Prizes for the Apple Design Awards](#), which included Best Mac OS X Leopard Graphics and Media Application, Best New Mac OS X Leopard Game (personally, I can't wait to see an original Mac game debuting at WWDC), Best iPhone Web Application and more. So, as you can see, there's much more to be looking forward to than just the 3G iPhone, as far as WWDC '08 goes.
