[Stunning Extra-slim Seesaw Phone Concept](#)

A new idea when it comes to design solutions

Seesaw phone
concept
Karsten Willmann

A new phone **concept** has bewildered all the lovers of slim handsets out there. The Seesaw cellular looks like the thinnest such device that anyone has ever dared of conceiving and manages to be catching. This Sony Ericsson phone concept has been developed by Karsten Willmann and looks stunning and **catchy** only as an idea. If brought to reality, it might just manage to turn the dreams of all those slim phone fanatics out there into reality.

Specifications on the sizes that such a device might come with have not been made, although the pictures present it as the world's slimmest phone to have ever been created. Still, production has not been a question up to now for the Seesaw phone model, as technological aspects have not been set. It might actually prove quite difficult for any cellular producers to combine high performances with such little space within the case. Some features have actually been revealed on the capabilities of the Seesaw mobile phone. It looks like it will also pack a camera with a flashlight in order to live up to the performances of most handsets which are available at this time. Moreover, the hinge has several **functions** that the phone relies on. It might seem unaesthetic at first, but it is actually meant to provide enough space for the camera and also to angle the display up for best viewing, when lying on a desk. Due to this special feature, the OLED display can be read in any situation and always manage to provide best display quality. The phone is an innovative concept which manages to take the slim phone design down to the extreme. Whether we will actually see a cellular similar to the Seesaw model in the near future or not is actually a bit uncertain, if not even hard to believe.
