[The Vistas Are Old News, New Unique Windows Wallpapers and Screensavers Available](#)

For download

When Windows Vista was released on the market, taking into consideration only the consumer launch in January 2007, the operating system was accompanied by a wide collection of visual content designed to make it unique in the context of Windows clients. Vista brought to the table a new set of wallpapers, new screensaver, and an overhauled style under the Windows Aero brand umbrella. Vista has, without a trace of a doubt, its unique collection of characteristics defining a personality that sets it apart from all its predecessors. Now, by definition, and in contrast with the Windows client, Microsoft's server operating systems are a tad more dull, with the emphasis placed on functionality rather than on eye candy. But, according to Vijayshinva Karnure, from Microsoft in India, Windows Server 2008 for example can be used as a workstation operating system, effectively bringing the next step in evolution compared to Windows Vista Gold, and even Windows Vista RTM. And as was the case with Windows Vista, there is also additional content, tailored on Windows Server 2008. Via the [Server Unleashed website](#) for Windows Server 2008, in the Toy Box category, you will be able to find four wallpapers at different resolutions ranging from 1,024x768 to 1,900x1,200. There are also two screensavers available for download for PC users, as well as a range of buddy icons. All the content features the Windows Unleashed robot that represents Windows Server 2008 SP1. "The System Information tool identifies the release version of Windows Server 2008 as Service Pack 1. This is expected behavior. Windows Vista and Windows Server 2008 share the same code base. We are unifying the servicing between the two products to simplify the long-term maintenance process and to reduce support costs for customers. To do this, we are changing the files that are required to align the servicing components. Changing these necessary files contributes to the larger size of the stand-alone image," Microsoft [stated](#).
