Adobe Photoshop Express

Digital images are a very common term for most of the Internet users. There are many free online services providing tools for image storage, presentation and editing (processing). Adobe Systems Incorporated has released Adobe Photoshop Express, a Rich Internet Application that allows you to edit, publish and share your photos in image galleries for free. Adobe Photoshop Express is made with the help of Flex, the Adobe framework for creating Rich Internet Applications. After a quick process of registration, you will be able to upload photos and organize them in albums (you will get 2 GB of storage space for your photos for free). The photos could be sent through email and edited online. You should not think that the online photo editor is a web version of Adobe Photoshop desktop application. As compared with the desktop version, Adobe Photoshop Express image editor has only a few features, but they are enough to enhance your photos online. The set of tools provided to tweak your photos allows you to remove red-eye, auto correct images, perform various tuning actions (highlight, sharpen, white balance, focus) and apply effects (filters). You can also return to the original image any time by reverting all of image processing actions. The images can be shared in various ways. Adobe Photoshop Express provides you the possibility to upload or download photos from other social networking websites like Facebook. The photos are displayed by default in image albums that could be linked in other social networking websites or blogs. To be able to use Adobe Photoshop Express, you will need Flash player version 9. You can test the free Adobe Photoshop Express Rich Internet Application performance by going to the [Adobe website](#).
