## [Windows Vista Brute-Force Attack Alive and Kicking](#)

### *Vista Brute Force KeyGen is far from dead*

The Windows Vista brute-force crack is alive and still kicking. While the original Windows Vista Brute Force KeyGen has proved to be nothing more than a hoax, with its author coming up in the open and not only apologizing for creating the crack but also revealing that it was not functional, the key generator workaround for Vista is not yet history. Not even by far. In fact, the Windows Vista brute-force crack has survived and even got updated. However, it appears that the Vista Brute-Force Method GUI 0.1 + SourceCode has a new father that identifies himself as "stof91." "I strongly suggest that you use SoftMod, if you are looking to illegally activate Windows Vista. (Which doesn't mean that I'm not against it). I stopped development, and will only continue if everyone stops complaining and if it's needed, I had a look at SoftMod.. and it seems that it's the way to go... The application will stay online, until it is removed... after that, you can pm me if you want it," stof91 revealed. However, he does offer not only the Windows Vista brute-force crack with a streamlined interface but also the proof-of-concept for the workaround. The brute-force attack is designed in such a manner that it will randomly search for legitimate product keys for the operating system. The actual functionality is similar to the first version released by ComputerUser. This version brings nothing new to the table in comparison to the original release, and as such it is just as much of a hoax, although the author did provide a screenshot designed to prove that the brute force attack actually works.
