[openSUSE 11.0 Beta 3 Resolves Over 700 Bugs](#)

Also includes new artwork and updated software!

The third and last beta version of openSUSE 11.0 [was announced](#) last night. Beta 3 fixes over 700 bugs, adds some new artwork and a few updated packages. Among the new technologies and applications included in the final version of openSUSE 11.0, due for release on June 19th, you'll find: Linux kernel 2.6.25; GCC 4.3.0; PulseAudio 0.9.10; AppArmor 2.3; PackageKit 0.2.0; Xen 3.2.1; glibc 2.8 CVS; libzypp 3.12.1

The openSUSE developers have found some bugs, which are not fixed yet. Here is a short list with the most annoying ones and their workarounds:

- NVIDIA cannot be compiled. Workaround: go [here](#) for a patch and how to apply it;
- The legacy SFF ATA controller doesn't work because the parallel driver grabs IRQ14;
- T41p shuts down due to "temperature critical";
- The branding is not finished yet;
- Package selector does not show any patterns at all;
- The openSUSE control center, YaST, cannot be started under GNOME;
- No window decoration. Workaround: run the 'compiz-manager &' or 'metacity-replace &' commands;
- Sometimes, KDM is unable to detect the keyboard;
- When you start Kontact, you'll see the sidebar splitter on right window border. Workaround: move it to the left to see the rest of the components.

Remember that this is a beta release and should NOT be installed on production machines. It is intended to be used for testing purposes only. Please report bugs to the [openSUSE Bug Tracker](#).
